兰州重离子研究装置

HEAVY ION RESEARCH FACILITY IN LANZHOU

2019年度报告 (中文)

一、综述及基本情况

兰州重离子研究装置（HIRFL）经过三个大科学工程的建设及多次改进，已经成为我国能量最高、规模最大的重离子加速器，为开展重离子物理基础研究和交叉学科研究提供了先进的实验条件，同时积累了丰富的重离子回旋加速器和同步加速器建造的关键技术和经验。现在的 HIRFL 由电子回旋共振（ECR）离子源、1.7 米扇聚焦回旋加速器（SFC）、大型分离扇回旋加速器（SSC）、SSC 直线注入器（SSC -Linac）、冷却储存环(CSR)主环和实验环、放射性束流线、实验终端等主要设施组成。

近代物理所于 20 世纪 60 年代初建成了 1.5 米经典回旋加速器，通过轻核反应实验研究，为我国氢弹研制作出了贡献。70 年代初，在国际重离子物理迅猛发展的形势下，将 1.5 米回旋加速器改建成能加速较轻重离子的加速器，在我国率先开展了低能重离子物理基础研究。

1976 年 11 月，国家计委批准由近代物理所负责设计建造兰州重离子加速器的主加速器系统，主要建设一台大型分离扇回旋加速器及几个实验终端。同时，由中科院匹配经费把原 1.5 米回旋加速器改建成 1.7 米扇聚焦回旋加速器作为注入器。兰州重离子加速器的主加速器 SSC 和注入器 SFC 于 1988 年建成，其主要技术指标达到当时国际先进水平，1992 年获国家科技进步一等奖。SSC 与 SFC 联合运行，可以把重离子加速到中等能量，用以开展远离稳定线新核素合成、中低能重离子碰撞和热核性质、重离子束应用等研究。并于 1991 年经国家发改委批准成立了“兰州重离子加速器国家实验室”。

为使我国重离子物理研究继续在部分前沿领域保持国际先进性，同时深入开展重离子治疗肿瘤等交叉学科研究，近代物理研究所经过多年的研究及反复论证，并结合我国国情，提出了在 HIRFL 上扩建多用途的冷却储存环（CSR）工程。CSR 作为国家“九五”重大科学工程，于 1997 年 6 月经国务院科技领导小组审议通过，2000 年 4 月经国家发改委批准开工建设，2008 年 7 月通过国家验收，正式投入运行，2012 年获国家科技进步二等奖。

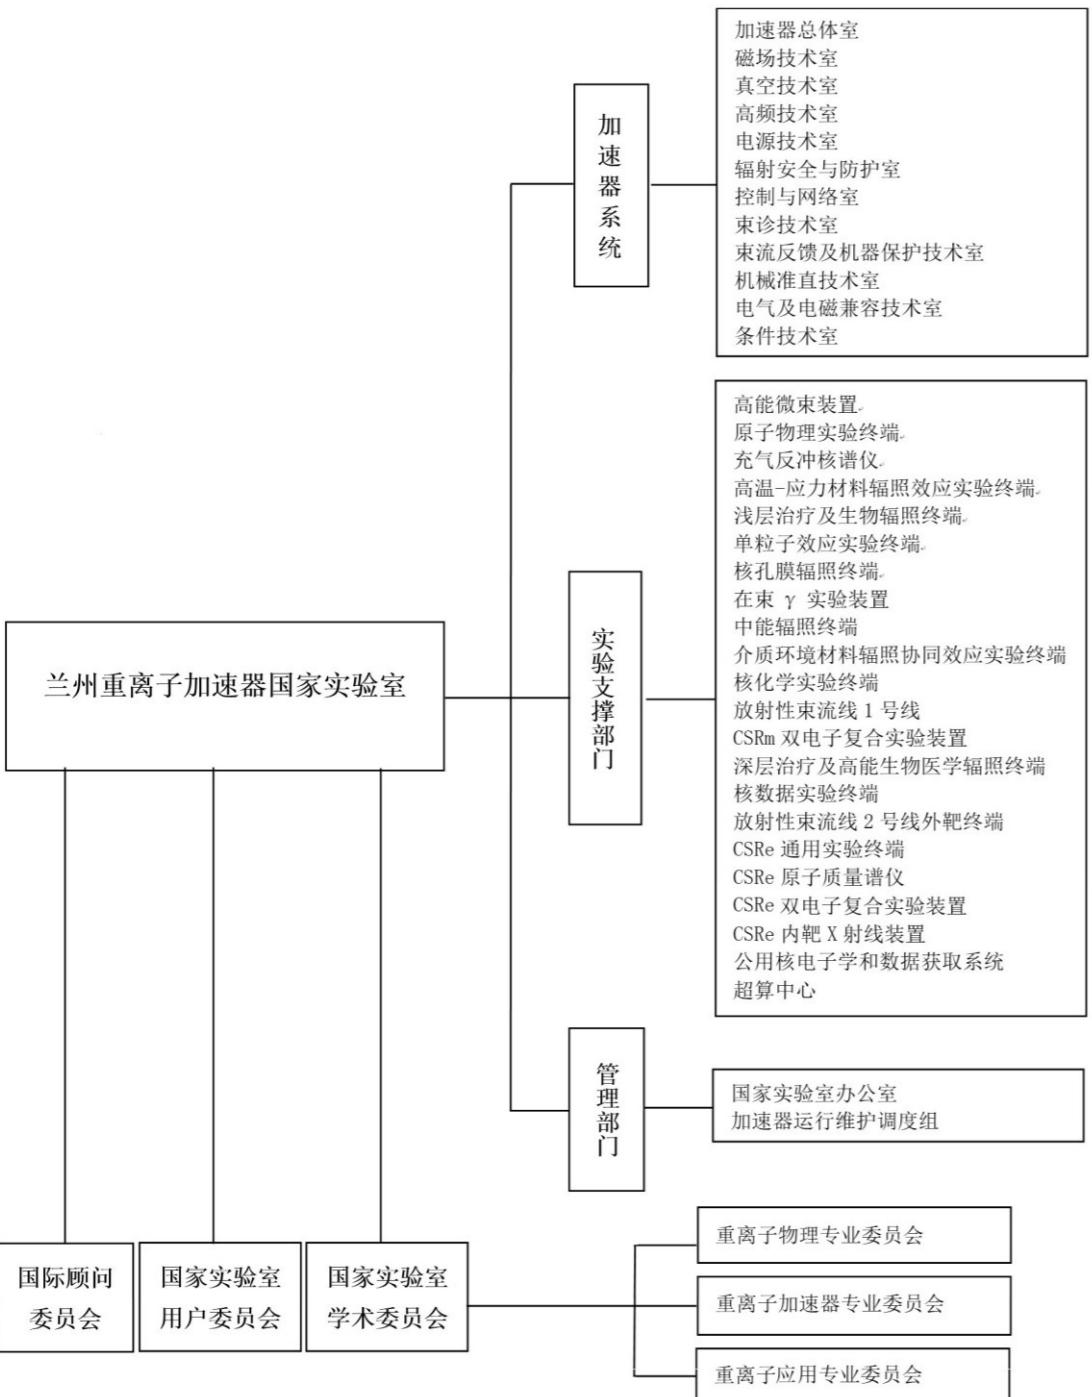

兰州重离子加速器的建成，大大提高了我国先进离子加速器物理及技术和核物理及相关学科的国际地位，使兰州重离子加速器国家实验室成为国际上重要的重离子研究中心，增强了我国在重离子物理及其交叉学科国际前沿领域的竞争力。近代物理所依托兰州重离子加速器取得了以首次合成 25 种新核素特别是两种超重新核素为代表的一批原始创新成果，实现了我国新核素合成零的突破，并开始了超重新元素探索研究的征程；核结构、重离子碰撞和热核性质研究进入国际前沿；从理论和实验两方面对重离子碰撞及热核性质的同位旋相关性研究，获得重要成果；在等时性工作模式下完成了高精度核素质量测量，不仅使得 HIRFL-CSR 实验环高精度原子核质量测量进入国际先进行列，所获数据在天体核物理研究中也具有重要意义。

HIRFL 是我国核物理及相关交叉领域的大型科研平台，将为以下几个方面的进一步发展发挥更强大的支撑作用：在重离子物理基础研究领域，开展短寿命原子核质量精确测量、弱束缚核结构和反应机制、超重核（元素）性质、核物质性质、高离化态离子碰撞动力学和谱学研究，取得一批在国际上有重大影响的研究成果；在重离子束应用研究领域，开展重离子治疗肿瘤临床试验、重离子治癌机理和诊断及治疗新技术、航天电子器件单粒子效应、离子辐照诱变育种、重离子与特殊环境下材料作用研究，解决与离子辐射相关的关键技术，创造显著的社会经济效益并服务国家重大需求；前瞻部署高能量密度物质性质和空间辐射效应等一批重点研究方向，形成新的学科增长点。

设施负责人

国家实验室主任	沈文庆	副主任	肖国青、赵红卫、夏佳文、徐瑚珊
国家实验室学术委员会主任	张肇西	副主任	陈森玉、王克明、叶沿林、周小红

组织框架

承担国家重大项目

项目	学科领域及课题研究内容
基金重点	基于兰州重离子加速器实验装置物理目标的原子核多体系统理论研究 用于高能量密度物态及惯性约束核聚变诊断的新型高能电子成像关键技术研究 基于单腔多束型加速器的超高强流重离子加速器的前沿研究 丰中子超重核素分离关键技术
重大项目（课题）	直接测量 AGB 星中关键核反应 $^{19}\text{F}(\text{p},\text{a})^{16}\text{O}$ 在伽莫夫能区的反应截面 天体物理能区关键中子源反应 $^{13}\text{C}(\text{a},\text{n})^{16}\text{O}$ 的直接测量 粒子与新型纳米器件材料相互作用物理机理
重大科研仪器研制项目	低能量强流高电荷态重离子研究装置
杰出青年基金	高功率射频超导质子直线加速器 强流高功率离子加速器束流累积新方法和关键技术
优秀青年基金	激光离子源物理与技术研究
联合基金重点项目	弥散强化的铁基和钒基合金在强辐照条件下脆化机理的研究 宽能域离子束在等离子体中的能量沉积及其激发的自调制不稳定性和尾波场 高能重离子单粒子效应微纳成像技术研究 丰质子区 N=126 附近核素衰变性质研究 基于 HIRFL-CSR 开展中高能轻核诱发核反应研究 离子辐照/LBE 腐蚀协同作用引起铁铬基合金结构演化的机理研究
国家重点研发计划	天体环境中关键核过程研究 高电荷态离子非平衡动力学时空演化研究 多模式引导的多粒子生物适形调强新技术研究与实现 高精度核物理实验研究 新一代强流重离子加速器关键束流物理和核心

二、研究进展与成果

2019年，兰州重离子加速器国家实验室的用户依托 HIRFL 取得一批重要研究成果。

国内首台自主知识产权碳离子治疗系统获批注册上市

2019年9月29日，由近代物理所及其控股公司兰州科近泰基新技术有限责任公司研制的碳离子治疗系统（图1）获批第三类医疗器械产品注册，标志着我国有了自主品牌碳离子治疗设备，实现了国产重离子治疗设备零的突破，该设备目前安装于甘肃省武威肿瘤医院，入选“中科院2019年度科技成果转移转化亮点工作”。

国产碳离子治疗系统的获批注册给肿瘤患者带来了新的希望，将有效缓解我国恶性肿瘤先进技术供给不足的问题，对于提升中国肿瘤诊疗手段和水平具有重大意义。

自1993年以来，近代物理所通过先进加速器技术和核探测技术的研发、重离子束治疗相关生物学基础研究以及与相关医疗机构合作进行的临床前期研究积累，培养了一支高水平的重离子治疗技术人才队伍，掌握了相关核心技术。其研发的具有自主知识产权的碳离子治疗系统突破了国外产品的专利壁垒，提高了性价比、降低了运行维护成本，实现了国产重离子治疗设备零的突破，探索出了一条“基础研究→技术研发→产品示范→产业化应用”的全产业链自主创新之路，对实现“健康中国”和战略性新兴产业发展具有重要意义。

首次发现新核素²²⁰Np 并检验到 Np 同位素 N=126 的壳效应

中科院近代物理所、广西师范大学、北京大学、同济大学、中科院理论物理所、俄罗斯联合核子研究所等国内外9家单位的科研人员利用兰州重离子加速器的充气反冲核谱仪 SHANS 装置开展了相关实验，在N≈126的轻锕系核区首次观测到了Z=93的新核素²²⁰Np，这是继发现新核素^{219, 223, 224}Np之后，在该同位素链中发现的又一个新核素。借助于先进的波形采样数字化电子学系统，研究人员首次观测到了新核素²²⁰Np的8个α衰变事件。实验中测量的²²⁰Np 衰变链中各核素的α衰变能谱和α衰变寿命的分布如图2所示。基于新测量的α衰变性质以及结合之前发表的²¹⁹Np 和²²³Np 的数据，研究人员在Np同位素的N=126中子壳附近，首次建立了α衰变系统性规律(如图3(a)和(b))。

重核素的α衰变系统性规律是反映原子核壳效应的重要实验依据。根据获得的实验结果，研究人员首次给出了N=126壳效应在Z=93 Np同位素中仍然存在的实验证据。同时，确定了Np同位素中质子滴线的准确位置（如图3(c)），这一结果是在Z≥83的奇Z核区，首次将丰质子核素的质子滴线位置扩展到了Z=93的同位素中，这也是目前已知的质量数最大的质子滴线位置。

该工作得到了国家重点研发计划、中国科学院B类先导科技专项培育项目、国家自然科学基金项目、中国科学院前沿科学重点研究项目、广西自然科学基金项目以及俄罗斯基础研究项目的支持。

相关研究成果以亮点文章“编辑推荐”（Editors’ Suggestion）的形式在线发表于国际顶级物理学期刊 Physical Review Letters 上。

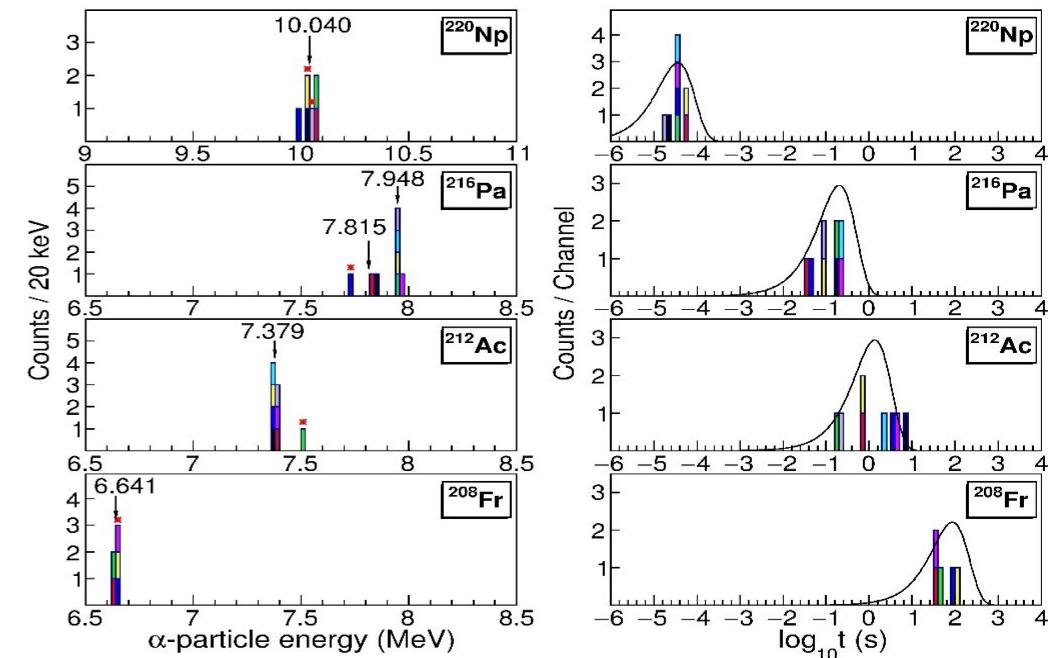

图2. 实验测量的²²⁰Np 衰变链中各核素的α衰变能谱(左)和α衰变寿命的分布(右)。

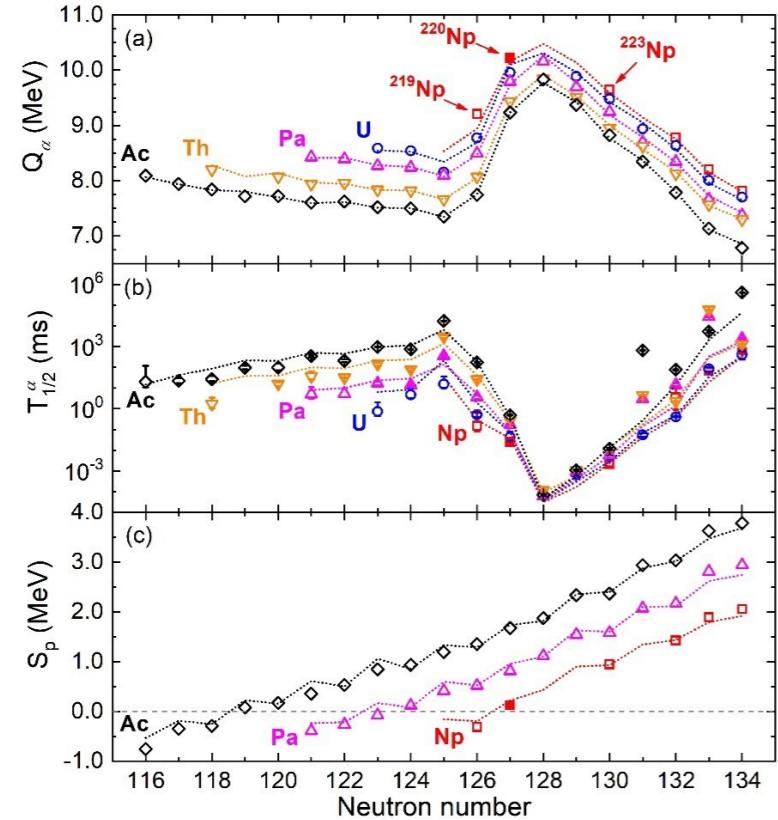

图 3. $89 \leq Z \leq 93$ 缺中子核素的 α 衰变 Q 值(a)和半衰期(b)的系统性规律, 以及奇 Z 核 Ac、Pa、Np 同位素的单质子分离能随中子数变化的系统性(c)。

质子滴线核衰变研究中的新进展

中国原子能研究院、中国科学院近代物理研究所、北京大学、香港大学、西班牙加泰罗尼亚理工大学等多家单位的科研人员依托兰州重离子加速器在质子滴线核衰变谱学研究方面取得新进展。

研究人员利用自主研发的硅探测器阵列及前端电子学系统, 测量了 ^{27}S 的 β 缓发 γ 射线谱和迄今为止统计最高的 β 缓发质子谱, 构建了较为完整的 ^{27}S 衰变纲图, 与壳模型理论计算结果进行了对比(图 4), 并给出了目前精度最高的 ^{27}P 质量测量值。基于新的实验结果, 发现计算的 $^{26}\text{Si}(p,\gamma)^{27}\text{P}$ 热核反应率远低于 REACLIB 天体数据库推荐值。

在美国举行的第六届国际质子发射会议上, 研究人员以特邀报告形式报告了相关研究成果, 获得国际同行认可。

该研究得到了国家重点研发计划、国家自然科学基金、中国博士后科学基金等项目的支持。文章发表在美国物理学会期刊 Physical Review C。

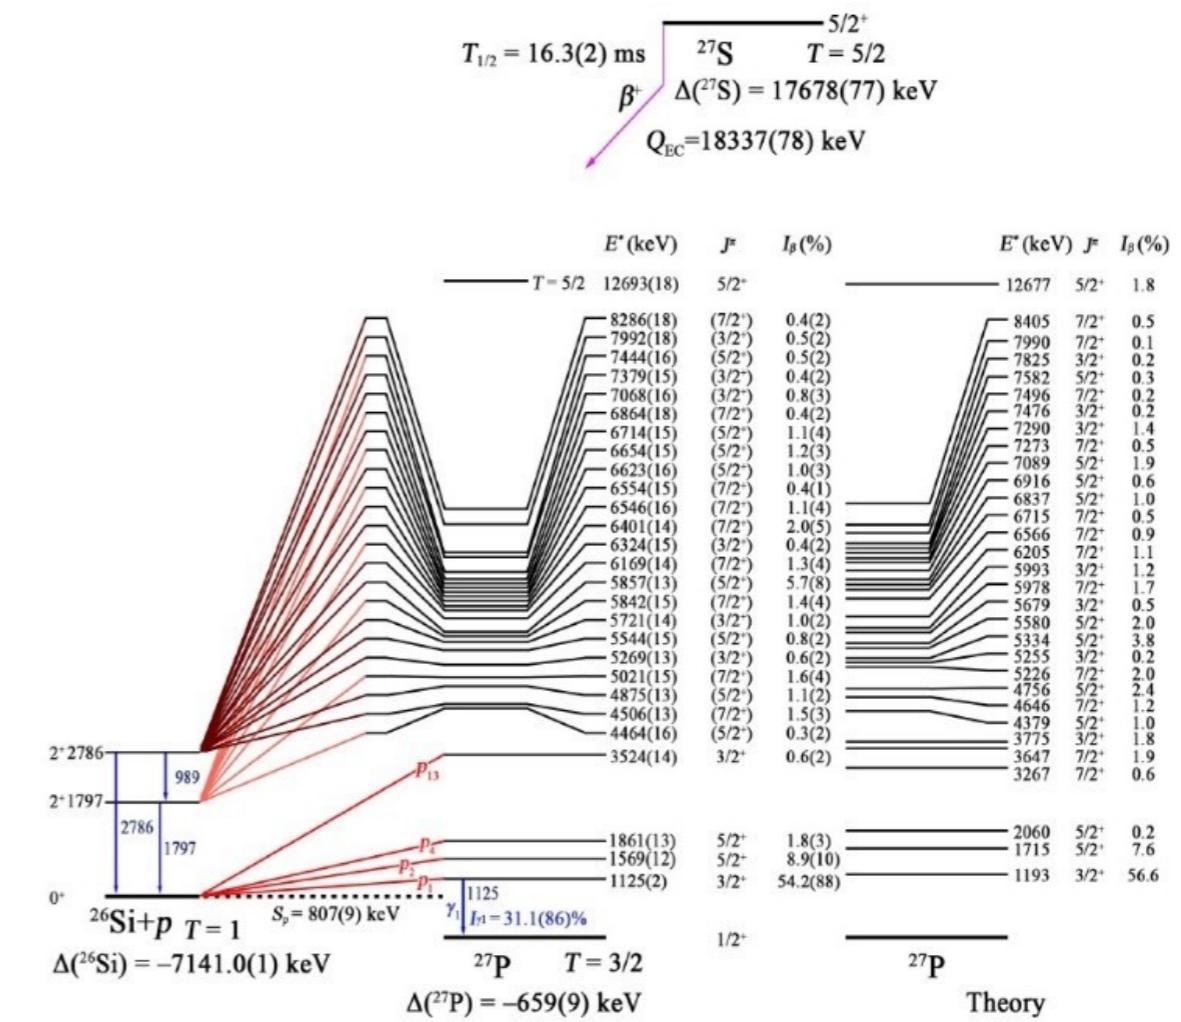

图 4. ^{27}S 衰变纲图, 实验结果与壳模型理论计算结果对比

类氟 $^{58}\text{Ni}^{19+}$ 离子的双电子复合精密谱学实验研究获进展

中国科学技术大学联合中科院近代物理所及德国吉森大学等多家单位的科研人员依托兰州重离子加速器冷却储存环 HIRFL-CSRM, 开展了类氟镍离子($^{58}\text{Ni}^{19+}$)的双电子复合实验, 获得最新进展。

实验结果得到 0-160 eV 范围内, 包含 $\Delta N = 0$ 所有内壳层跃迁的双电子复合通道。拟合实验结果, 得出横、纵向电子束温度分别为 0.56(0.05) meV 和 23(1) meV。研究人员将实验结果与 Flexible Atomic Code (FAC) 计算的结果仔细对比, 解析出每个共振结构的来源。同时还从双电子复合速率系数得到了可用于等离子体建模的等离子体速率系数, 并与此前的理论计算结果作了对比研究。本次实验结果为天体物理等离子体建模研究提供了数据基准。

该工作得到科技部重点研发计划、国家自然科学基金项目、中科院战略性先导科技专项 B 和中科院重点前沿项目、中科院青年创新促进会的支持。

文章发表在天体物理学专业杂志 *Astronomy & Astrophysics (A&A)* 上 (*A&A* 627, A171 (2019))。

快重离子辐照调制石墨烯电学性能研究

石墨烯作为一种纳米级的新型二维材料, 在电学方面能够实现亚微米级的弹道输运及较高的载流子本征迁移率, 有望成为新一代电子元器件的基材。然而目前重离子辐照对石墨烯基器件电学性能影响的研究工作较缺乏, 辐影响机理仍不清楚。

中科院近代物理研究所研究人员依托兰州重离子加速器开展了快重离子辐照石墨烯晶体管引起电学性能改变的研究, 取得了重要进展。

研究人员设计并制备了360个具有不同长宽尺寸的石墨烯带的背栅型场效应晶体管(GFET)。基于兰州重离子加速器, 通过改变入射离子的能量和电子能损, 采用不同注量($5 \times 10^8 \text{ ions/cm}^2 - 5.4 \times 10^{10} \text{ ions/cm}^2$)的Ta束辐照GFET。对比不同辐照注量条件下石墨烯的电学性质变化, 发现快重离子辐照对石墨烯带的电学性能有调制作用。在低注量($\sim 10^9 \text{ ions/cm}^2$)下, 快重离子辐照会提升GFET的性能, 在较高注量($\sim 10^{11} \text{ ions/cm}^2$)下, GFET性能明显退化。当石墨烯带长宽比小于5时, 离子注量 $10^9 \text{ ions/cm}^2 - 4 \times 10^{10} \text{ ions/cm}^2$ 范围辐照后, GFET的电阻值减小(如图6(a)), 载流子迁移率增大(如图6(b))。

研究获得了重离子辐照GFET电学性能优化的条件, 在该条件下石墨烯载流子迁移率可提升约12倍。研究结果为石墨烯电学性能优化提供了新方法。

研究成果发表在工程技术类一区杂志: *Carbon*, 154 (2019) 244-253 (Impact factor 7.082)。

纳米孔的离子选择性增强传输研究取得新进展

核孔膜具有孔径分布均匀、孔尺寸和孔密度方便可调等特点, 目前已应用于水处理、药物筛选、除尘防霾等领域并发挥重要作用。但是核孔膜在溶液中离子的选择性分离和过滤方面仍有不足, 尤其是核孔膜的离子选择性和通量的“跷跷板”效应更是难以权衡。

中科院近代物理研究所科研人员将氧化石墨烯膜制备技术与核孔膜技术相结合, 制备出氧化石墨烯膜/聚合物复合纳米孔结构, 用以开展复合结构中的离子传输特性研究。

科研人员利用兰州重离子加速器提供的高能重离子对PET聚合物进行辐照, 再结合非对称化学蚀刻得到PET锥形纳米孔, 然后利用旋涂法在PET纳米孔上制得氧化石墨烯薄膜(GOM), 形成GOM/PET复合结构。氧化石墨烯膜与核孔膜相结合, 在提高阳离子通量的同时, 抑制了阴离子的传输, 使得体系的离子整流系数从4.6增加到238.0, 实现了溶液中阳离子的选择性增强传输。另外, 该结果在促进微纳流控制器件研制和氧化石墨烯纳滤膜研究方面也具有重要意义。

该工作得到国家自然科学基金项目支持, 成果发表在国际化学领域期刊 *ACS Applied Materials & Interfaces* 上。

纤维素酶水解碱处理秸秆可视化研究方面取得新进展

木质纤维素是地球上储量最丰富的生物质资源之一，纤维素酶降解技术是生物转化高效利用木质纤维素的关键。纤维素酶水解木质纤维素过程中木质素的作用方式（阻止纤维素酶吸附？还是存在非降解性吸附？）一直存在争议，纤维素酶对植物细胞壁具体降解方式的研究也未见报道。因此，木质纤维素的有效前处理和纤维素酶水解植物细胞壁过程的可视化研究，将大大提升木质纤维素生物炼制效率。

科研人员在纤维素酶水解碱处理秸秆的过程研究中取得新进展。研究人员发现，当采用稀碱、稀酸和过氧化氢对甜高粱秸秆进行化学前处理均提高了秸秆生物质的酶水解效率，其中稀碱前处理的酶水解效率达到了 86.44%。采用显微镜实时成像和荧光共聚焦技术（CLSM）进行了酶水解过程的可视化研究，观察到了纤维素酶水解细胞壁的具体方式，即纤维素酶先溶解植物细胞壁中部，然后从中间向两端移动，最后降解细胞壁角隅，纤维素酶对细胞壁的总体水解效率与细胞壁中木质素含量成反比。CLSM 结果表明植物秸秆中维管束组织被高度木质化，在纤维素酶水解木质纤维素过程中，纤维素酶与木质素发生了非功能性吸附，减少了与纤维素的功能性吸附。稀碱前处理甜高粱秸秆可以有效的去木质化，减少木质素与纤维素酶的非功能性吸附，提高了植物秸秆的酶水解效率。

此项工作从秸秆纤维素结构变化和酶水解过程可视化两个层面研究了植物细胞壁的前处理效应和纤维素酶水解方式，该结果将有助于从植物组织水平上设计植物细胞和组织类型，以降低其天然抗降解屏障，从而提高天然木质纤维素类材料的转化利用率。

相关研究成果发表在生物质能源期刊 *Biotechnology for Biofuels*。该研究得到中国科学院重点项目的资助。

五、合作与交流

2019年，全所职工出国（境）参加国际会议、访问以及合作研究406人次，接待来访和合作外籍专家332人次。在我所进行长、短期科技合作和学术交流工作的外国专家达163人次。分别与欧洲CERN、俄罗斯JINR、FLN、日本CNS、白俄罗斯NAS签订了合作备忘录。

5月18日至19日，兰州重离子加速器开展了第十五个公众科学日。作为迎接新中国成立70周年和建院70周年的系列活动，活动共安排有参观兰州重离子加速器等7大板块，充分展示了近代物理所在“面向世界科技前沿、面向国家重大需求、面向国民经济主战场”方面做出的重大科技创新成果，展现了科技造福人类的美好愿景，塑造了近代物理所良好的社会形象。活动还邀请了研究所精准扶贫帮扶联系点临夏和政县陈家集镇王泉村小学及幼儿园师生共计18人来到现场参加活动，活动两日共接待社会公众5000余人。

同期，以“科技强国 科普惠民”为主题的2019年全国科技活动周暨北京科技周在北京军事博物馆启动。近代物理所碳离子治癌系统和加速器驱动的嬗变研究装置模型参展。

听取胡正国副所长关于碳离子治疗系统的汇报

六、大事记

1月24日，新投入运行的SECRAL-II超导离子源为兰州重离子加速器不间断连续稳定供束超过1000小时，创造了同类高电荷态离子源单次不间断连续运行的世界纪录。

1月26日，兰州重离子加速器(HIRFL)国家实验室2019年束流评审会在兰州召开。

5月18日至19日，兰州重离子加速器国家实验室举办“科技强国 科普惠民”第十五届公众科学日活动。

5月31日，兰州重离子加速器国家实验室离子束辐照材料学术研讨会在兰州召开。

7月12日，浙江省副省长成岳冲调研兰州重离子加速器。

图11. 成岳冲副省长参观兰州重离子加速器

8月22日，国务院副总理刘鹤在中科院兰州分院召开科技创新座谈会，深入了解重离子治癌及医用同位素相关事宜。

图12. 刘鹤副总理听取徐瑚珊所长关于重离子治癌、医用同位素等工作的汇报

9月11日，甘肃省政协主席欧阳坚一行赴兰州重离子医院、中国科学院近代物理研究所现场督办十二届二次会议《关于继续加大力度争取国家支持我省国产重离子治疗装置产业化的提案》，并在近代物理所召开了协商座谈会。

图13. 省政协十二届二次会议重点提案督办协商座谈会

9月29日，碳离子治疗系统获批上市，该产品安装于甘肃省武威肿瘤医院，是国内首台由国家药品监督管理局批准注册的国产碳离子治疗系统。

图14. 2019年10月10日，碳离子治疗系统注册上市新闻发布会在京召开

11月1日，国务院副总理刘鹤参加中国科学院建院70周年成果展，听取肖国青研究员对碳离子治疗系统的汇报。

图 16. 11月22日，中国科学院近代物理研究所赵红卫研究员当选中国科学院院士。

12月17日，中科院近代物理研究所自行设计研制的国内首台连续波高电荷态强流重离子直线加速器（SSC-Linac）与分离扇回旋加速器（SSC）联合调试，首次成功引出了5.98 MeV/u 的⁴⁰Ar⁷⁺离子束流，标志着兰州重离子加速器（HIRFL）进入多注入器供束新时代。

兰州重离子研究装置

HEAVY ION RESEARCH FACILITY IN LANZHOU

2019年度报告 (英文)

I. Overview

Heavy Ion Research Facility in Lanzhou (Lanzhou Heavy Ion Accelerator, HIRFL), operated by the Institute of Modern Physics, Chinese Academy Sciences (IMP), is the largest heavy ion research facility in China and one of a few large-scale full-ion accelerating systems in the world, which can accelerate ions from hydrogen to uranium to high energy for domestic and growing international user-communities. HIRFL comprises a number of conventional and superconducting magnet Electron Cyclotron Resonances (ECR) ion sources, the Sector Focused Cyclotron (SFC), the Sector-Separated Cyclotron (SSC), the experimental Cooler Storage Ring (CSR) which is a multi-purpose research system consisting of a Main Ring (CSRm), an Experimental Ring (CSRe) and a radioactive beam line (RIBLL2) connecting the two rings, a fragment separator – the radioactive Ion Beam Line (RIBLL1) and some experimental devices, etc.. It has worked on nuclear physics, atomic physics, heavy ion applications and interdisciplinary researches. Based on HIRFL, IMP dedicates to fundamental researches in nuclear physics, nuclear astrophysics and atomic physics, including high precision mass measurement of short-lived nuclides, nuclear structure and reaction, properties of nuclear matter, synthesis of new heavy isotopes, chemistry of super-heavy elements, nuclear reaction in stellar environment, spectroscopies and interactions of highly-charged ions.

The SFC is the 1.5m classic cyclotron built in 1962 and later upgraded into a 1.7m Sector Focus cyclotron. Running alone, it can provide beams for low energy heavy ion physics studies.

In December 1988, Lanzhou Heavy Ion Accelerating System (SFC+SSC), designed and constructed by IMP, was completed and put into operation. In August 1991, the National Laboratory of Heavy Ion Accelerator of Lanzhou was approved by the State Planning Committee and opened to the public.

In July 1997, a middle energy radioactive ion beam line (RIBLL) with innovative structure was constructed at HIRFL, which has paved the way for the research on radioactive ion beam physics in China. With the superconducting ECR ion source built in 2005 having the best performance in the world at that time, the operation of HIRFL has reached an internationally advanced level. In June 2005, the successful acceleration of the uranium ions was carried out.

The Heavy Ion Research Facility in Lanzhou-Cooler Storage Ring (HIRFL-CSR) was commissioned in 2008. The HIRFL-CSR is a multi-functional facility, not only accumulating and cooling but also accelerating heavy ions from Carbon to Uranium up to 1 GeV/u to hundreds of MeV/u. Internal target experiments with highly charged ions, external target experiments with both extracted stable and radioactive beams and high precision mass measurement experiment have been carried out. It can provide experiment complex for research in heavy ion physics and its interdisciplinary subjects in China.

IMP has achieved many innovations at HIRFL over the past year: 30 plus new nuclides have been synthesized for the first time in the world, among which two are super-heavy nuclides; the mass of 35 radioactive nuclides have firstly been measured in the isochronous

mode and the relative measurement precision of more than fifty nuclides has increased; the independently researched and developed heavy ion medical machine (HIMM) has realized the zero breakthrough of domestic heavy ion therapy equipment; new species and strains of several crops have been fostered by utilizing heavy ion irradiation induced mutation; and that the popular plantation of optimized sweet sorghum in western China has developed into industrial chain, contributing to the regional economic development.

II. Research progress and results

Significant results and achievements at HIRFL – 2019

China's First Self-developed Carbon-ion Treatment System Gets Approval for Registration and Market Access

On Sept. 29, 2019, China's carbon-ion treatment system, which is self-developed by the Institute of Modern Physics, Chinese Academy of Sciences (IMP) and its holding company -Lanzhou Kejin Taiji Corporation, LTD., obtained the approval of the National Drug Regulator for the Class-III Medical Device Product registration. It is the first time that the National Medical Products Administration has approved a domestically produced carbon-ion treatment system.

Since 1993, through the research and development of advanced accelerator technology and nuclear detection technology, basic biological researches related to heavy ion beam therapy and the accumulation of pre-clinical research conducted in cooperation with relevant medical institutions, IMP has cultivated a high-level team of the heavy ion therapy technical team and mastered relevant core technologies. It is installed in Wuwei Cancer Hospital in Gansu province.

This system realizes a zero breakthrough of domestic heavy ion therapy facility. Meanwhile, it improves the cost-effectiveness and reduced the operation and maintenance expenses.

New isotope ^{220}Np : probing the robustness of the $N = 126$ shell closure in neptunium

The examination for the persistence of shell effects for nuclei far from stability is an intriguing topic in contemporary nuclear physics. While the onset of deformations together with the weakening of magic shell effect in most proton-rich isotones with neutron number $N=126$ was expected, the extension of nuclei in this region of the nuclear chart is undoubtedly interesting for checking the nuclear shell model.

In this work, a research team led by Prof. GAN Zaiguo from the Institute of Modern Physics, Chinese Academy of Sciences reported the discovery of a new nucleus ^{220}Np with proton number $Z=93$ and neutron number $N=127$. The experiment was carried out on the gas-filled recoil separator SHANS at HIRFL in Lanzhou. Eight correlated alpha-decay chains from ^{220}Np were identified significantly. Their decay-energy spectra and decay-time distributions for each chain member are shown in Fig. 2. The measured alpha-decay properties (see Fig. 3) of the new neptunium isotope as well as the recently reported $^{219,223}\text{Np}$, around the $N=126$ closed shell and 11 protons above the well-known doubly magic center ^{208}Pb ($Z=82$, $N=126$), allowed us for the first time to test the stability of the $N=126$ shell effect in Np isotopes. In addition, the new results indicated that, in the region of nuclei with $Z \geq 83$, the proton drip line has been reached for all odd- Z isotopes up to Np. Prior to this work, the last identification of the proton drip line in this mass region was for $Z=91$ protactinium in 1995, more than twenty years ago.

This work has been done in collaboration with research institutes and universities from China and Russia, totally 9 research organizations, which was supported by the National Key R&D Program of China, the Key Research Program of the Chinese Academy of Sciences, the National Natural Science Foundation of China, the Chinese Academy of Sciences, the Natural Science Foundation of Guangxi, and the Russian Foundation for Basic Research.

Progress on β -decay protons spectroscopy research

β -decay spectroscopy provides valuable nuclear physics input for accurate modeling of nova and x-ray burst observables and a stringent test for shell-model theories far from the stability line. The decay scheme of ²⁷S is complicated and far from being understood due to a lack of experimental data prior to this work.

Researchers from the China Institute of Atomic Energy, the Institute of Modern Physics of Chinese Academy Sciences, Peking University, Hong University, Shanghai Jiao Tong University, Guangxi Normal University, etc. made the latest progress in β -delayed proton spectroscopy research.

The researchers measured the β -delayed γ -ray spectrum of ²⁷S and β -delayed proton spectrum with the highest statistical so far by using self-designed and developed detection system composed of several DSSDs and Quadrant silicon detectors, constructed the relatively complete decay scheme of ²⁷S, and gave the ²⁷P quality measurement value with the highest accuracy compared with the result of theoretical shell-model calculations. Based on the new experimental results, it was found that the calculated thermonuclear ²⁶Si(p, γ)²⁷P reaction rates was far lower than that recommended in REACLIB astronomical databases.

The work is supported by the National Key R&D Program of China, the National Natural Science Foundation of China, the Youth Innovation Promotion Association of Chinese Academy of Sciences, the China Postdoctoral Science Foundation and the Office of China Postdoctoral Council under the International Postdoctoral Exchange Fellowship Program (Talent-Dispatch Program).

The proton emissions to different ²⁶Si states are indicated by using different shades of red (gray). Right: ²⁷P levels populated in ²⁷S β decay obtained from a USD shell-model calculation

Progress on the high precision dielectronic recombination spectroscopy experiment with F-like ⁵⁸Ni¹⁹⁺

Electron-ion recombination is one of the most important collision processes in the plasma. Accurate recombination rate coefficients are the basic input parameters for the plasma model in astrophysics and fusion science. Radiation associated with dielectronic recombination (DR) is usually used to probe the plasma properties, such as electron density and electron temperature. In addition, atomic energy levels can be obtained by analyzing the resonant features. Further studies, such as QED test, isotope shift measurement and hyperfine induced (HFI) transitions, can be approached with high precision DR spectroscopy. Storage rings equipped with electron coolers serve as ideal platforms for electron-ion collision experiments, in particular for the recombination at low collision energies.

Researchers from University of Science and Technology of China (USTC), Institute of Modern Physics of Chinese Academy of Sciences, Giessen University (Germany), Fudan University and Northwest Normal University have performed DR experiments with F-like ⁵⁸Ni¹⁹⁺ at the cooler storage ring (HIRFL-CSRM). DR spectrum in the energy range 0-160 eV, including all the DR channels associated with $\Delta N = 0$ core excitations, is obtained. The parallel and perpendicular electron temperatures are $k_B T_{\parallel} = 0.56(0.05)$ meV and $k_B T_{\perp} = 23(1)$ meV, respectively, according to the fitting of the low energy spectrum. The experimental

results are compared with the theoretical calculation with Flexible Atomic Code (FAC) in detail. The origins of all the resonance features are analyzed. Moreover, we have deduced the plasma recombination rate coefficients and compared with the present as well as the previous theoretically calculated data. The experimental results constitute a set of benchmark data for use in plasma modeling.

The work is partly supported by the National Key R&D Program of China, the National Natural Science Foundation of China, the Strategic Priority Research Program of Chinese Academy of Sciences, the Key Research Program of Frontier Sciences and the Youth Innovation Promotion Association of Chinese Academy of Sciences.

Black dotted line is the experimental result; red solid line is the calculation with FAC; blue solid line is the contribution of radiative recombination (RR); vertical bars are the calculated resonance positions. (right panel) Plasma recombination rate coefficients as a function of electron temperature. Black solid line is the experimentally derived data; the red lines (solid: present; dash: Gu 2003) are the calculated ones with FAC. The others are the previous calculations.

Selectively enhanced ion transport in graphene oxide membrane/PET conical nanopore system

Graphene oxide (GO) in the form of partially oxidized graphene has attracted great attention as a new functional material because of its atomically thin thickness, two-dimensional structure, high strength and chemical stability. In this paper, the ultrathin GO membrane (GOM) is spin-coated on PET conical nanopore which can not only support the GOM but also possess ion rectification effect. It is confirmed that the existence of GOM enhances the cation transport but depresses the anion, which gives rise to enhanced ion rectification effect. COMSOL simulation proves that the GOM can collect cations from reservoir and act as cation source for selective ion transportation in PET conical nanopore. The GOM/PET conical nanopore can display good selective ion transport features in a wider pH range than pure PET conical nanopore because of the chemical stability of graphene oxide. Finally, we believe that the combination of GOM and conical nanopore is a facile design that not only can magnify the ion rectification effect of conical nanopore but also can selectively increase the ionic current, which makes the GOM/PET conical nanopore hold great potential in nanofluidic sensor design and high-efficiency separation membrane production.

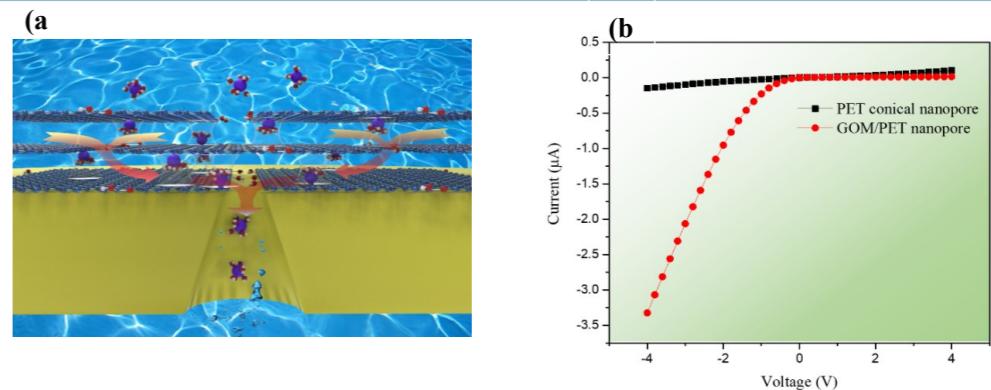

Fig. 6 (a) The schematic picture of ion transport through GOM/PET conical nanopore (b) The ionic transport properties of PET conical nanopore and GOM/PET nanopore

Graphene electrical properties modulated by swift heavy ion irradiation

The electrical properties of graphene have attracted much attention since its first successful isolation from the bulk graphite by mechanical exfoliation method. Excellent electrical, thermal and optical properties make graphene a very suitable alternative for the silicon. However, the electronic properties of graphene are expected to be strongly influenced by the presence of defects. Several researchers have shown that electron-beam and energetic ion irradiation induce shift in charge-neutral point (CNP) and degrade the performance of the graphene field effect transistors (GFETs). The mechanism behind this process is controversial and unclear so far.

SHIs (1.79 GeV Ta) provided by the accelerator HIRFL at IMP were used to irradiate GFETs. It was found that at lower fluence (10^9 - 10^{10} ions/ cm^2), the SHIs irradiation can effectively optimize the performance of GFETs, while at higher fluence ($\sim 10^{11}$ ions/ cm^2), the electrical properties of the devices were significantly deteriorated after the irradiation process. As shown in Fig.4 (a) and (b), the improvement of electrical properties of GFET more easily occurs when L/W is lower than 5 and the irradiation fluence is in the range of 1×10^9 ions/ cm^2 - 4×10^{10} ions/ cm^2 . It was found that the competition among various factors such as the doping, local annealing and defect creation dominates the GFET performance. This work explores the best conditions for improving the electrical properties of GFETs and provides a significant reference data for the utilization of graphene based irradiated devices in aerospace electronics.

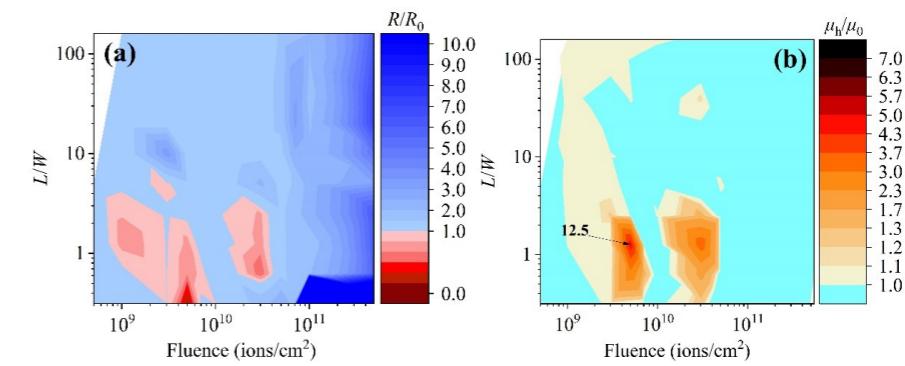

Fig. 7 (a) relative resistance as a function of graphene shape (L/W) and ion fluence. (b) evolution of relative mobility for the holes (μ_h/μ_0) with L/W and ion fluence.

III. Construction, operation and upgrading

In 2019, HIRFL has been operated for about 7392 hours, including 438.5 hours for the accelerator study and 5312 hours for 182 experiments on the targets. The operation efficiency is about 71.43%. In this year, 2671.5 beam hours were used for the nuclear and atomic physical experiments, 2065 beam hours for the material sciences, 191.5 beam hours for life sciences (biological sciences), and 384 beam hours for space sciences.

HIRFL has provided 25 kinds of heavy ion beams for various experiments, especially, 17 kinds of which were provided for the experiments firstly by HIRFL (detailed in Table 1) in this year. A summary of the HIRFL operation is shown in Table 2.

Table 1. the Typical Ion Beams Provided by HIRFL in 2019

Table 2: Distribution of HIRFL Operation Time in 2019

Operation time distribution	Time (h)	Percentage (%)
Total operation time	7392	100
Failure time	208.5	2.8
Preparation of beam	586.5	7.9
Beam testing	830	11.21
Other time	16.5	0.2
Target beam time	5750.5	77.8
Nuclear physics	2671.5	46.5
Material sciences	2065	35.9
Biophysics	191.5	3.3
Space sciences	384	6.7
Machine study	438.5	7.6

IV. Scientific & technical personnel and talent training

The total number of staff for HIRFL is up to 446, composed of 250 operating and maintaining staff, 174 researchers and other 11 employees. 235 out of the 446 have senior and 141 have intermediate title. In addition, regarding to the postgraduate education at IMP in 2019, up to 73 students have graduated from IMP with a doctoral degree or a master degree whereas 416 students have been doing their postgraduate work.

In order to train, attract and keep talented personnel, the Institute of Modern Physics, Chinese Academy of Sciences (IMP) has taken a series of effective measures. The “Huang He Zhi Zi” project for talents is implemented, “IMP Award for Young Talent in Science and Technology” and “Foundation of Director” are initiated; second, young talents are assigned important tasks in major projects to make them experienced; third, the good opportunities of international cooperation are fully enjoyed to jointly foster practical and creative talents of science and technology with celebrated institutions and prestigious universities around the world.

V. Cooperation and exchange

This year, totally 406 researchers and staff at IMP have gone abroad to attend international conferences, visit the long-term collaborative and international research organizations and participate in or conduct the international cooperative researches and

experiments. Meanwhile, researchers from all over the world are warmly welcomed to IMP for studying, doing experiments or for making the research presentations or lectures. Significantly, in this year, IMP has established the long-term international collaboration relationships with CERN in Switzerland, JINR & FLN in Russia, CNS and NAS by signing the Memorandum of Understanding. Furthermore, the 18th International Conference on Ion Sources was successfully held by IMP, in Lanzhou, China; this is a biennial international event in the ICIS series after recent three conferences hosted in Geneva, New York City, and Chiba, respectively. After 6 years, this conference turns to Asia again. It was the second time that this event had been hosted in China after the ICIS1993 in Beijing hosted by PKU. (Group Pic. see Fig. 8)

Fig. 8 the 18th International Conference on Ion Sources (ICIS2019)

From May 18th to 19th, 2019, the 15th Public Science Day organized by the Heavy Ion Research Facility in Lanzhou (HIRFL). In this event HIRFL received more than 5000 visitors.

Fig. 9 the 15th Public Science Day organized by HIRFL

On May 18th, 2019, the self-developed Carbon-ion Treatment System and the Accelerator Driven System by IMP were exhibited during the 2019 National Science and Technology Week at the China People's Revolution Military Museum, Beijing, China.

In September 2019, HIRFL was exhibited in the achievements exhibition for celebrating the 70th anniversary of the founding of the People's Republic of China at Beijing Exhibition Center, Beijing, China.

In November 2019, Innovation achievements exhibition for celebration the 70th anniversary of the founding of the Chinese Academy of Sciences (CAS) was held in the National Science Library, Chinese Academy of Sciences. HIRFL, Synthesis of new isotopes, High-accuracy Mass Measurements of short-lived exotic nuclides, the Carbon-ion Treatment System, advanced nuclear energy system, etc. were selected for the exhibition.

VI. Chronicle of events

On Jan. 24th, 2019, the latest operational superconducting magnet ion source – SECRAL-II made a new world record of the same highly charged ion sources with single continuous operation without interruption, which has provided more than 1000 hours of stable ion beams for HIRFL.

On Jan. 26th, 2019, Annual HIRFL Beam Review Meeting was held in Lanzhou.

From May 19th to 20th, 2019, the 15th Public Science Day was successfully organized with the theme of “S&T Innovation strengthening the Nation and enriching the people” at IMP.

On May 31st, 2019, NLHIRFL ion beam irradiation materials academic seminar was held in Lanzhou, China.

From Sept. 1st to 6th, 2019, the 18th International Conference on Ion Sources was successfully held by IMP, in Lanzhou, China.

On Sep. 29th, China's first Carbon Ion Cancer Treatment System was approved and registered for market by National Medical Products Administration, which was installed at the Wuwei Tumour Hospital in Wuwei, Gansu Province.

On Dec. 27th, the joint commissioning of the first highly charged heavy ion linear accelerator with continuous wave for SSC (SSC-Linac) designed and fabricated by IMP and SSC was accomplished. 5.98Mev/u $^{40}\text{Ar}^{7+}$ ion beam has been successfully extracted. It marks the new era of multi-injectors for HIRFL.

附表 2 运行单位和用户获授权发明专利一览表(2019 年度收到)

序号	专利名称	当前权利人	发明人	专利类型	授权日
1	一种核燃料小球的制备装置及制备方法	中国科学院近代物理研究所	田伟;秦芝;曼努埃尔亚历山大普冲	发明专利;发明专利	20190726
2	将反应堆从次临界状态转换到临界状态的方法	中国科学院近代物理研究所	詹文龙;杨磊	发明专利;发明专利	20190924
3	用于去除铜表面镍镀层的化学退镀液和退镀方法	中国科学院近代物理研究所	初青伟;谭腾;何源;郭浩;熊平然;游志明	发明专利;发明专利	20191008
4	靶系统和具有靶系统的用于产生中子和/或中微子的系统	中国科学院近代物理研究所	杨磊;高笑菲;林平;张晟;詹文龙	发明专利;发明专利	20190927
5	高温辐照端变装置	中国科学院近代物理研究所	李炳生;王志光;魏孔芳;申铁龙	发明专利;发明专利	20191018
6	一种上旋式液态金属无窗散裂靶构件	中国科学院近代物理研究所	杨伟峰;张雪莹	实用新型	20191115
7	功率输入耦合器	中国科学院近代物理研究所	王若旭;李永明;蒋天才;何源;张生虎	发明专利;发明专利	20191115
8	一种真空密封用不锈钢法兰	中国科学院近代物理研究所	王若旭;郭浩;黄玉璐;覃腾;何源	实用新型	20200107
9	一种光电信增管高压电源模块	中国科学院近代物理研究所	王彦渝;尹俊;张亚鹏;倪发福	发明专利;发明专利	20200124
10	双热窗型的功率输入耦合器	中国科学院近代物理研究所	李永明;王若旭;蒋天才;何源;张生虎	发明专利;发明专利	20200221
11	一种高温高压水气流体效应模拟装置的使用方法	中国科学院近代物理研究所	王志光;马志伟;姚存峰;刘超	发明专利;发明专利	20191206
12	轮盘提升机	中国科学院近代物理研究所	杨磊;张建荣;高笑菲;杨阳阳;张延师;麻礼东	实用新型	20191115
13	束流自适应校正器件及校正电极板	中国科学院近代物理研究所	于得洋;薛迎利	发明专利;发明专利	20191115
14	一种直接分离二氧化铀或者乏燃料中稀土元素的方法	中国科学院近代物理研究所 厦门稀土材料研究所	詹文龙;秦芝;詹文龙;杨帆;赵志钢 范芳丽;秦芝;詹文龙;杨帆;赵志钢	发明专利;发明专利	20200124
15	磁力提升装置	中国科学院近代物理研究所	詹文龙;杨磊;张学智;张延师;高笑菲	实用新型	20190927
16	高压电缆连接头及其使用方法	中国科学院近代物理研究所	李明睿;高大庆;上官婧斌;高杰;冯秀明;封安辉;孙鹏;钱其三; 李继强;孙志强;陈晓明;肖野;张帅;李晓辉;陈皓;赵江	发明专利;发明专利	20190625
17	反应堆燃料组件的锁紧与提升机构以及锁紧与提升方法	中国科学院近代物理研究所	朱彦雷;顾龙;于锐;蔡义林;彭天骥;王大伟;李金阳;秦长平;刘 璐;盛鑫;唐延泽;张璐;田旺盛;冯丽	发明专利;发明专利	20190719

18	高温铅铋熔体中自动化控氧/腐蚀装置及方法	中国科学院近代物理研究所	常海龙;王志光;姚存峰;孙建荣;张宏鹏;李炳生;盛彦斌;魏孔芳;徐瑚珊	发明专利;发明专利	20190726
19	电荷测量电路	中国科学院近代物理研究所	杨海波;孔洁;干爽;苏弘;赵红斌;余乾顺;牛晓阳;蒲天磊;马晓利	发明专利;发明专利	20191220
20	汽车用锂电池隔膜及其制备方法	中国科学院近代物理研究所	梁伟;莫丹;蔡晓红;袁平;杜榕	发明专利;发明专利	20191206
22	一种离子泵性能测试和优化装置及其测试和优化方法	中国科学院近代物理研究所	杨伟顺;蔚晓建;张喜平;刘建龙;蒙峻	发明专利;发明专利	20200117
23	基于GPU并行架构的束流轰击颗粒的能量沉积仿真方法	中国科学院近代物理研究所	杨磊;田园;高笑菲;林平	发明专利;发明专利	20191220
24	磁环组件和制造磁环组件的方法	中国科学院近代物理研究所	赵红卫;张子民;李家庆;王辉;马保华;孙良亭;张雪珍;谢祖祺;翟浩银	发明专利;发明专利	20190830
25	核孔膜大气辐射传动装置	中国科学院近代物理研究所	莫丹;袁平;刘杰;孙友梅;李运杰;姚会军;段敬来;曹殿亮	发明专利;发明专利	20190104
26	一种四翼型RFQ加速器腔体冷模测量装置	中国科学院近代物理研究所	王峰峰;张斌;李晨星;金晓风;赵博;张周礼;王志军;张军辉;何源;于培炎	发明专利;发明专利	20190528
27	一种用于放射治疗中患者摆位的实时验证装置及方法	中国科学院近代物理研究所	申国盛;李强;陈卫强;姬腾飞;戴中颖;刘新国;马圆圆;贺鹏博;张晖	发明专利;发明专利	20190726
28	一种抑制高阶模电磁场的热阴极微波电子枪	中国科学院近代物理研究所	宗阳;曹树春;申晓康;赵全堂;张子民	实用新型	20190827
29	一种用于Gantry磁体的倾斜螺线管	中国科学院近代物理研究所	梁羽;吴巍;梅恩铭;马力祯	发明专利	20190827
30	一种用于骨样本试验的机械力装置	中国科学院近代物理研究所	王菊芳;何进鹏;华君瑞;危文俊;张亚楠	实用新型	20191206
31	固态氢靶系统和使用它的激光离子源	中国科学院近代物理研究所	孙良亭;赵环昱;沈叮叮;张俊杰	发明专利;发明专利	20200124
32	高频腔失谐检测单元	中国科学院近代物理研究中心	张瑞峰;许哲;王贤武;丛岩;李世龙;韩小东	实用新型	20190712
33	ECR离子源感应炉	中国科学院近代物理研究所	卢旺;钱程;孙良亭;李立彬;黄维	实用新型	20200103
34	储能发电装置以及间歇式发电系统	中国科学院近代物理研究所	詹文龙;杨磊	实用新型	20190219
35	抗菌型PM2.5复合过滤材料制备方法及其应用	中国科学院近代物理研究所	梁伟;莫丹;蔡晓红;袁平;杜榕	发明专利;发明专利	20190312

序号	类别	项目名称	主要完成人
36	直线加速器和同步加速器	惠州离子科学研究中心;中国科学院近代物理研究所	殷学军;杜衡;夏佳文;李钟仙;李小妃;杨雅清;王科桥;孔启宇;张翔;杨鹏;姚庆高
37	靶系统和具有靶系统的用于产生中子和/或中微子的系统	中国科学院近代物理研究所	杨磊;张晟;高笑菲;林平;付芬;詹文龙
38	控氧液态铅铋腐蚀和离子辐照协作研究实验装置	中国科学院近代物理研究所	姚存峰
39	轮盘提升机	中国科学院近代物理研究所	杨磊;杨阳阳;高笑菲;张建荣;刘伟明;张延师
40	一种评估颗粒流集体摩擦磨损行为的实验装置	中国科学院近代物理研究所	庞立龙;王志光;常海龙
41	ECR离子源金属炉测试装置	中国科学院近代物理研究所	卢旺;钱程;孙良亭;李立彬;黄维
42	病毒培养方法	中国科学院近代物理研究所;中国疾病预防控制中心病毒病预防控制所	胡步荣;陈亚雄;段招军;潘冬;杜亚蓉;谢广成;庞立丽;宋敬东
			发明专利;发明专利
			谢漪
